Task 4 : Stored Procedures & ETL Concepts

Task A: Create a procedure to fetch employees with salary > 100000 and insert them into high_salary_table

```
CREATE OR REPLACE PROCEDURE copy_high_salary_employees()
AS $$
        DECLARE
          v_count INT;
        BEGIN
          CREATE TABLE IF NOT EXISTS high_salary_employee
          (
            emp_id INT,          employee_fname TEXT,
            salary INT,
            dept_id INT
          );
          INSERT INTO high_salary_employee (emp_id, employee_fname, salary, dept_id)
          SELECT employee_id, employee_fname, salary, dept_id
          FROM employee
          WHERE salary > 100000;
          RAISE NOTICE '% employees copied', v_count;
        END;
$$
LANGUAGE plpgsql;

CALL copy_high_salary_employees();
```

Explanation:

This procedure creates the table `high_salary_employee` if it does not exist and inserts all employees whose salary is greater than 100,000. It automates the process of copying high-salary employees into a separate table for easier management or reporting.

Task B: Create a view with employees whose salary is more than 100000

```
create or replace view high_salary_view as select
employee_fname,employee_lname,salary from employee
where salary > 100000 and employee_fname is not null and employee_lname is not null;
```

Explanation:
This query creates a view high_salary_view that includes only employees with salaries above 100,000 and non-null first and last names. The view allows easy querying of high-salary employees without repeatedly writing the filter conditions.
